Introducing the Needotron: working out the shape of the product

Richard Pope - former Product Manager for GOV.UK, Government Digital Service, 19 September 2011 - GOV.UK

Working out the exact "shape" of the gov.uk beta has been a long, difficult process. Working out what needs it should meet, how best each need should be met and then defining how the whole proposition hangs together are hard problems.

La Rencontre avec les "Dieux"

Signal 2: They Solve “People Problems” with Code (and Empathy)

Average engineers complain about “user error” or “stupid requirements.”

The Potential Leader seeks to understand the root cause. If the Sales team keeps entering data wrong, they don’t just blame Sales; they build a better UI validation tool to help them. They view non-technical colleagues as partners, not annoyances.

- **Look for:** The developer who talks to the Customer Support team to understand why a bug keeps happening.

Signal 3: They Think in Systems, Not Just Features

Junior engineers focus on the ticket: “Build the login button.”

The Potential Leader focuses on the system: “If we build the login button this way, how will it affect our security compliance next year? How does this impact the mobile app?”

They demonstrate **Strategic Foresight**. They are willing to slow down today to prevent technical debt tomorrow.

- **Look for:** The person who asks “Why?” in sprint planning meetings, challenging the roadmap to ensure it aligns with the long-term architecture.

Signal 4: They Own the Outcome, Not Just the Output

hold and express similar views.

Strategies to manage and minimize cynicism about change

- Keep people involved in making decisions that affect them.
- Emphasize (and reward) relationship-oriented behaviour for supervisors.
- Keep people informed of ongoing changes: When, why, how: inform people fully about progress and problems associated with ongoing change processes, and the results of change programs. Information minimizes employee's opportunities to fill in the blanks of missing information, and makes it difficult to conclude that most or all changes have been failures.
- Enhance the effectiveness of timing
- Keep surprising changes to a minimum: Routine notice about what is happening and especially why it is happening prevents anyone's being

Concluding remarks

14 In many ways the Verify programme is an example of how government h
tackle a unique and unusual problem, adapting over time in response to lesso
and the changing nature of the external market. Government has identified fra
growing threat across the modern economy, both within and beyond the publ
and that confidence in identity is an important element of protecting services
In an attempt to strengthen online identity while maintaining a high degree of
GDS has helped to define standards, build the Verify platform, and develop th
of private sector identity providers. After struggling to build demand within the
sector for Verify, government has now decided to hand over control of Verify t
from 2020 with the aim of encouraging its use for non-government services, t
wider benefits and build scale that may benefit government in the longer term
lower prices.

15 Unfortunately, Verify is also an example of many of the failings in major p
that we often see, including optimism bias and failure to set clear objectives. E
context of GDS's redefined objectives for the programme, it is difficult to conc
successive decisions to continue with Verify have been sufficiently justified

written testimony.

> My name is Frances Haugen. I used to work at Facebook and joined because I think Facebook has the potential to bring out t best in us. But I am here today because I believe that Facebook products harm children, stoke division, weaken our democracy and much more. The company's leadership knows ways to mak Facebook and Instagram safer and won't make the necessary changes because they have put their immense profits before people. Congressional action is needed. They cannot solve this crisis without your help. I believe that social media has the potential to enrich our lives and our society. We can have socia media we enjoy — one that brings out the best in humanity. Th internet has enabled people around the world to receive and share information and ideas in ways never conceived of before

“How can I get people on board with my controversial plan?”

So you have a great idea, and you’re eager to get started. Awesome!!! You believe it’s going to make people’s lives better, even though you know you are going to have to fight tooth and nail to make it happen.

What NOT to do:

Walk into the team meeting and drop your bomb idea on everyone cold:

> “Hey, I think we should stop shipping product changes until we fix our build pipeline to the point where we can auto-deploy each merge set to production, one at a time, in under an hour.” ~ (for example)

…. then spend the rest of the hour grappling with everybody’s thoughts, feelings, and intense emotional reactions, before getting discouraged and slinking away, vowing to *never have another idea,* ever again.

What to do instead:

Suss out your audience. Who will be there? How are they likely to react? Are any of them likely to feel especially invested in the existing solution, maybe because they built it? Are any of them known for their strong opinions or being combative?

Great!!! Your first move is to **have a conversation with each of them**. Approach them in the spirit of curiosity, and ask what they think of your idea. Talking with them will also help you hash out the details and figure out if it is *actually* a good idea or not.

Your goal is to make the rounds, ask for advice, identify any allies, and talk your idea through with anybody who is likely to oppose you…*before* the meeting where you intend to unveil your plan. So that when that happens, you have:

Le Retour

Maître des Deux Mondes

Egoless development is **not about surrendering convicti**
becoming passive. It's about letting the problem drive the
not the other way around. Gerald Weinberg, in his seminal w
Psychology of Computer Programming, wrote: "The most po
learning occurs when someone produces a better solution th
imagined." If your ego can't digest a "better" or "different" a
you have no business leading a software team.

In practice, egoless engineering means:

- **Staying open to new ideas** – even if they come from
  teammate or an external library.
- **Focusing on the product's value** – not on proving yo
  architectural choices.
- **Accepting feedback without defensiveness** – becau
  line of code is a hypothesis, not a manifesto.

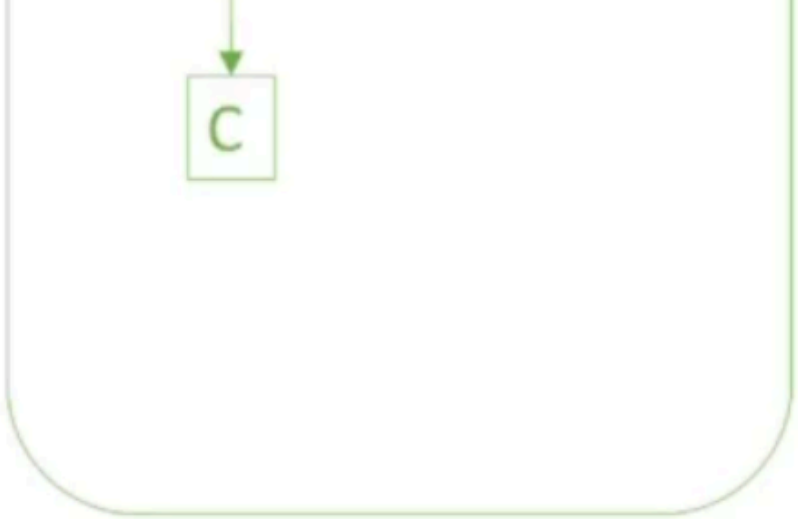
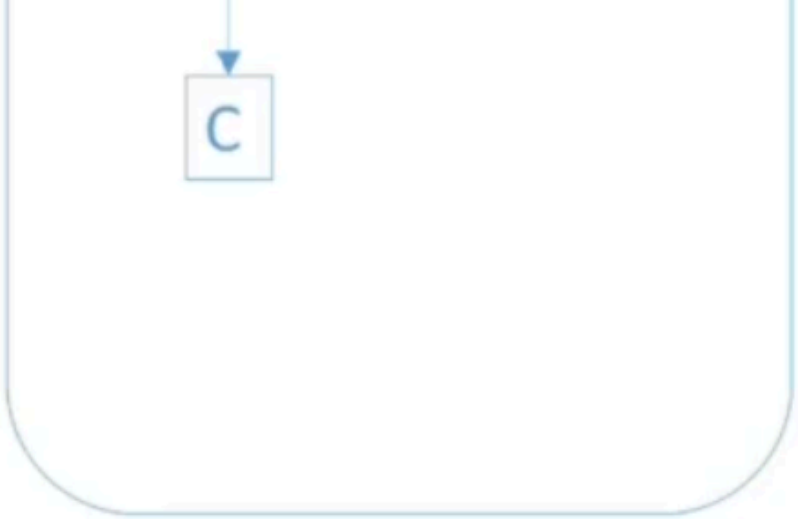
INSERT trunk! src/main.rs[+] rust-analyzer rust
-- INSERT --
test result: FAILED. 0 passed; 1 failed; 0 ignored; 0 measured; 3 filtered out; finish
stderr





This, again, is a falsifiable prediction. If, despite expectations, the test fails wrong. Most likely, it's the implementation that you just wrote, but it could is somehow defective. Or perhaps a circuit in your computer was struck by if the test passes, you've failed to falsify your prediction, which is the best

You now write a second test, which comes with the implicit falsifiable predi *test will fail*.
